

Customer-service workflow

Entirely fictional. Case snapshot: August 31, 2026. Synthetic organizational evidence for a hackathon prototype.

Journey and ownership

1. Customer request -> 2. Triage -> 3. Investigation -> 4. Knowledge search -> 5. Resolution attempt -> 6. Collaboration or escalation -> 7. Specialist involvement -> 8. Customer response -> 9. Closure. Steps 4-8 can repeat; a reopened case returns to investigation with the original ticket ID.

1-2 | Request and triage

Customer portal, email or premium incident line creates a CaseHarbor ticket. Frontline triage verifies the customer, entitlement, urgency, language and product. Suspected security incident? Transfer immediately to Security under the controlled incident procedure. Otherwise, assign a primary support owner. AccountVista supplies contract metadata through the nightly sync. Friction: stale entitlement fields, missing locale and duplicate email threads.

3-4 | Investigation and knowledge search

The owner gathers tenant version, logs, configuration and impact. Is evidence sufficient? If no, request customer diagnostics and keep ownership while waiting. If yes, compare the symptoms with DocNest articles, BuildTrack known issues and relevant product notes. Friction: customer approvals, screen switching, unfamiliar tenant history, search terminology and time-zone gaps.

5 | Resolution attempt

Is the proposed action within the agent authorization and reversible? If yes, explain it, secure required customer approval and attempt it. If no, route to the appropriate authorized specialist. Did it work? If yes, prepare confirmation. If no, return to investigation or collaborate. Record the steps already tried. Friction: limited sandbox availability and the time needed to summarize long threads.

Customer-service workflow / 2

6-7 | Collaboration and specialist involvement

The support owner first asks for help through TeamLine. If the issue needs a specialist decision, transfer or assign a technical task in CaseHarbor. Suspected product defect creates a BuildTrack link. Commercial exceptions go to the account manager; data or access exceptions go to Security. Specialist checks tenant context, recommends a resolution, workaround or engineering change, and returns the case to its owner. Friction: unclear cross-product responsibility, expert availability and incomplete transfer notes.

8-9 | Response and closure

The owner communicates the result and validates it with the customer. Confirmed resolution closes the case. A documented workaround can close with customer acceptance and a linked defect follow-up. If no confirmation arrives, the owner sends a reminder and applies the existing closure policy; reopening is available. Quality analysts sample closed cases. Article correction requests go to the relevant content owner. Customer Success receives account-risk concerns.

Where the journey branches

Security concern -> Security incident path. Missing customer evidence -> waiting state -> investigation. Authorized reversible action -> attempt -> customer validation. High-impact action -> specialist authorization. Product defect -> engineering task -> workaround or patch. Unresolved attempt -> repeat investigation. Customer confirms -> closure; customer reports recurrence -> reopen.

Measurement and handoff definitions

A handoff counts a change of primary accountable support team, not every internal message. Escalation records formal involvement of Technical Support, Engineering, Security or an authorized commercial decision-maker. Contacts are customer interaction cycles, including the initial exchange. Resolution time is elapsed clock time from opening to final closure, including customer waits and weekends. Escalation is sometimes the correct outcome, not automatically waste.

Feedback to the wider organization

Weekly operations reviews cover queue age, throughput and CSAT. Monthly Product reviews examine linked defects. Customer Success uses account-level service history during renewal planning. The workflow does not contain a causal attribution model for churn.
